__DevEngine v1.3.0: System Configuration Manual

Configured for Sovereign Mesh Operations | Architecture v1.3.0

1. System Overview

__DevEngine is a production-ready web diagnostic and modular system adaptation engine designed for Chrome DevTools and Linux-based workspace environments. It bridges deep DOM traversal, spatial collision analytics, and telemetry chaining.

2. Terminal-Style File Tree

```
~/workspace/
├── __DevEngine/

```

3. Operational Protocols

3.1 Injection Pipeline

• **Snippets**: Sources -> Snippets -> New Snippet -> Paste -> Ctrl/Cmd + Enter.
• **Local Overrides**: Sources -> Overrides -> Select Folder -> Save for override -> Inject.

3.2 Visual Documentation

• **Full-Page Canvas**: `Ctrl+Shift+P` -> "Capture full size screenshot".
• **DevTools Capture**: Undock -> `Alt+PrintScreen` (Win/Linux) or `Cmd+Shift+4+Space` (Mac).

4. Technical Context Hydration (AI)

This system utilizes structured JSON (`window.ppConfig`, `window.preload`) and AST analysis for automated indexing. The engine implements a 20-depth circuit breaker to prevent infinite recursive loops.

5. Quick Commands

- `__DevEngine.listComponents()` : Maps UI nodes, elements, and frames.
- `__DevEngine.scrapeDeepLogs('.line-content')` : Parses and clips log cells.
- `__DevEngine.orchestratePipeline('selector')` : Executes full diagnostic trace.
